Amendments to the Specification:

Please amend the Specification as follows:

[0041] If, on the other hand, the application is not of a type that can save a consistent working file without quitting at step 206, the process, at step 212, determines whether the application is of a type that creates a consistent recovery file without quitting but must quit to save the consistent working file. Word processing program generally save consistent recovery files when they quit to save a user's document from being lost in case of a failure. As is well known by those of skill in the art, word processing applications initiate and complete a save file operation before shutting down. Thus, as is well known in the art, after receiving a request to terminate or quit by a user, such word processing applications initiate and complete a save operation as the application quits. Word processing programs also generally save consistent recovery files while they are operating. If the application is such an application as described at step 212, the application is again observed by the process at step 214 to capture the consistent recovery file saved by the application at step 216. At step 218, a mapping is created between the captured recovery files and the saved consistent working file when the application quits.
